

Website Specifications

Loxos is the foundation for power lifters in southern Africa. When the word “loxos” is translated from Greek it means oblique, a muscle on the side of the abdomen.

Objective: Very often powerlifters find themselves lacking the necessary equipment/accessories that push them to excel their current limits. ***The goals of the loxos website are to:***

1. Provision of unavailable product: Provide unavailable equipment/accessories for lifters in need of them.
2. Community building: build a community in which our lifters can progress towards their goals with one another. loxos is about community building just as much as it is about the sales of lifting equipment. This expands the brand reach.
3. Brand identity/Authority: loxos aims to establish itself as the “Golden standard” for gym accessories in Southern Africa. The spillover effects of brand authority would naturally be more sales. If loxos is seen as the epitome of quality and production then more customers will be drawn to it.
4. Feedback loops for systems development: Feedback loops allow the business to develop highly efficient e-commerce and logistics systems. This is important because the site helps us test custom java integrations, automated inventory tracking systems.

Who is loxos catered to?

Target Audience: The loxos website is tailored for the fitness community, specifically the powerlifting demographic (16-50+).

Technical Aptitude Specification

1. User Profile Overview

The target audience (ages 16–50) possesses a **moderate to high** level of general technical proficiency, but their behaviors vary by sub-segment:

- **Ages 16–30 (High Proficiency):** Mobile-first users who expect instant load times, gesture-based navigation (swiping), and integrated social logins. They have low patience for non-intuitive layouts.

- **Ages 31–50 (Moderate to High Proficiency):** Desktop and mobile users who are comfortable with e-commerce workflows but prefer clear, labeled navigation over "mystery meat" icons (icons without text labels).

2. Device & OS Familiarity

- **Cross-Platform Navigators:** Users are adept at switching between mobile browsers (Safari/Chrome), dedicated apps, and desktop environments.
- **Standard Interface Conventions:** The audience understands standard UI patterns such as the "hamburger" menu, shopping cart icons, "pinch-to-zoom" for product images, and "pull-to-refresh" mechanics.

3. Payment & Security Literacy

- **Security-Conscious:** The audience is familiar with and expects SSL indicators (the padlock icon) and 3D Secure authentication (OTP via SMS/Email).
- **Digital Wallet Integration:** A significant portion of this demographic prefers "express" checkout options like Apple Pay, Google Pay, or saved browser card details over manual data entry.

4. Connectivity Assumptions

- **Varied Bandwidth:** While many will be on high-speed 5G or Fiber, the site must remain functional for users on unstable mobile data. Technical aptitude does not bypass physical speed constraints; therefore, the audience expects **lazy-loading** and **optimized images** to prevent lag.

5. Technical Constraints & Expectations

- **Zero-Instruction Policy:** The audience should not require a manual or "Help" section to complete a purchase. The UX must be self-evident.
- **Error Tolerance:** Users expect the system to handle common mistakes (e.g., auto-formatting phone numbers, validating email addresses in real-time) rather than returning a "Submission Failed" page after the fact.

1RM Calculator

1RM stands for **One Rep Maximum**, this is the amount of weight an individual can push in one go. The way it works is that the user inserts the heaviest weight they can push for more than one repetition ($X \text{ reps} > 1$) and then they insert the number of repetitions they can do with that weight.

The calculator will then provide the max amount of weight the user can push for one repetition and is stored in the loxos servers for the user to refer to months later.

```
// Logic for the LOXØS 1RM Calculator
public double calculateOneRepMax (double weight, int reps) {
    if (reps == 1) return weight;
    // Using the Epley Formula for technical accuracy
    return weight * (1 + (double)reps / 30);}
}
```

Adding the 1RM Calculator allows the user and developers to track the lifters progress.

Technical briefing.

Development Environment

- **VS Code (Visual Studio Code):** This was my **Integrated Development Environment (IDE)**. It acted as the primary workspace where I wrote, edited, and debugged all my code. Its built-

in tools (like syntax highlighting and extensions) helped me ensure the code was clean and error-free.

Frontend Technologies

- **HTML (HyperText Markup Language):** This is the **structural foundation** of the website. I used it to define the essential elements of the page—such as headings, paragraphs, images, and the overall "skeleton" that holds the content.
- **CSS (Cascading Style Sheets):** This is the **visual layer**. I used CSS to turn the raw HTML structure into an aesthetically pleasing design by applying the dark blue, black, and grey color palette, managing spacing (padding/margins), and ensuring the site is responsive on different screen sizes.
- **JavaScript:** This is the **interactive layer**. I used it to add dynamic logic to the site, such as making buttons functional, managing navigation menus, and handling user input without needing to refresh the page.

Hosting & Version Control

- **GitHub:** I used GitHub for two critical roles:
 - **Version Control:** To track changes in my code and maintain a history of my progress.
 - **Hosting:** Utilizing **GitHub Pages** to push my local files to a live server, making the website accessible to the public via a custom URL.

Hardware

- **Laptop:** My primary workstation used to run the development environment, perform local testing in browsers, and manage the deployment process to GitHub.

Taxonomy

How will the user come across the link?

Social Media

Loxos has multiple social medial accounts and in the descriptions of those accounts is the link leading to the website

Brand ambassadors

Loxos works alongside several brand ambassadors that promote the product and give customers promo codes with their name that they can use on our website so for instance an athlete may promote the site by saying “ for 50% off on all items on the loxos website use the **PROMO CODE:** loxos-carlos-123”.

The athletes receive a 25% split on all products bought via the promo code on our website.

User login

When a user opens the website via the link/or through referral they will be presented with a login screen in which they will be asked to enter their email address, first name, last name, age and gender.

This data will be saved in the loxos database so that users can be sent regular notifications on product info, package tracking and price changes.
